

Theatre Timers

Interval and Real Time

Applications

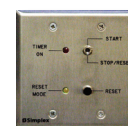

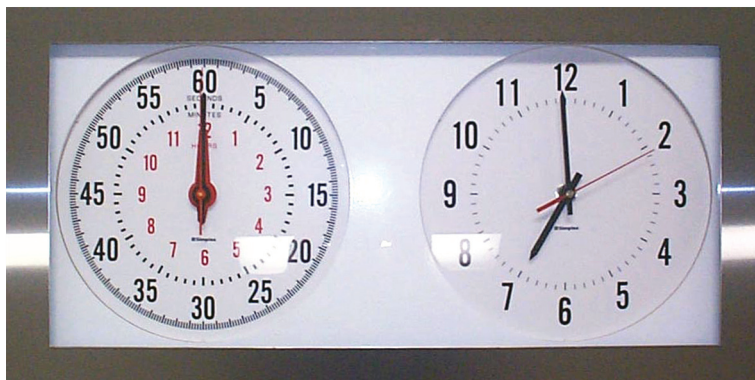

Simplex model 6311 theatre timers are for use in hospital deliver rooms, operating rooms, laboratories, schools, and industrial applications.

The dual theatre timer is designed to keep track of VITAL timed events throughout an operation by providing surgeons and support staff with both interval time and accurate referenced "real time" via Simplex ONTA 12-BK series slave clock. This system is housed in a stainless steel cabinet complete with shatter-proof acrylic enclosure.

Simplex Model 6311-12BK interval & real time includes a twelve hour elapsed time powered by 230V AC 50 Hz power and one network 12 hour Analogue clock connected to NTP(Network Time Protocol).

Operation

Manual operation from a 6311-9502 timer control is started by switch activation (START) which is indicated by the red timer-on LED. If the timing sequence must be stopped the STOP position will instantly stop the hands without coasting due to a "dead-stop" motor control feature. Reset is activated by pushbutton, if the control switch is in the STOP/RESET position.
